Please combine the above medical knowledge, ask a question, and answer it with reference to the knowledge

Generated question and answer

Question: The patient is a 20-year-old female who has symptoms of generalized anxiety disorder lasting for more than 6 months, such as headache, chest tightness, and rapid heartbeat. Often worry about their abilities, appearance and what they do, and have ominous premonitions. Do I need an electrocardiogram?

Answer: As an auxiliary examination method, electrocardiogram examination can help doctors further understand the clinical symptoms and signs of patients, but it cannot be used to diagnose generalized anxiety disorder. If the doctor thinks it is necessary to perform an electrocardiogram, the patient should actively cooperate and carry out the examination according to the doctor's advice.
